

damping ratio is slightly removed. A series of numerical simulation showed that a strong pulse loading distorted an estimated impulse response function, and this distortion caused a large error in damping estimation. 200 simulations also demonstrated that higher nonstationarity increased a bias of estimates. In such a case, the recovering stationary source by SOBI provided more accurate estimation compared to the result of mixtures.

ACKNOWLEDGEMENT

This research was supported by grants from Korean Institute of Bridge and Structural Engineers (KIBSE). The authors wish to express their gratitude for the support.
